# Introduction

A password manager is a cybersecurity application designed to securely store and manage user credentials. In today's digital world, individuals use multiple online platforms, making it difficult to remember different passwords for each account. This project presents a simple web-based password manager developed using HTML, CSS, and JavaScript. It allows users to store their passwords securely using a master password and basic encryption techniques. The application demonstrates fundamental concepts of data protection and secure password handling.

# Problem statement

In today's digital world, users have multiple online accounts, which makes it difficult to remember different passwords for each platform. As a result, many users tend to reuse weak passwords or write them down in insecure places, increasing the risk of hacking and data breaches. This creates a serious cybersecurity issue, as unauthorized users can easily gain access to sensitive information. Therefore, there is a need for a secure and simple system to manage and store passwords safely.

# Project objective

The main objective of this project is to develop a simple and secure password management system that allows users to store and access their passwords easily. The application aims to enhance user security by using a master password system and basic encryption techniques. It also focuses on improving user awareness about password safety and reducing the risks associated with weak or reused passwords.

# Solution description

The proposed solution is a web-based password manager that enables users to securely store their credentials in a structured manner. The user sets a master password, which is used to access the application. Once logged in, users can add, view, and manage their saved passwords for different websites. The passwords are encoded using Base64 encryption and stored in the browser's localStorage. Additionally, the system includes features such as password reset and a “forgot password” option using a security question. This approach simplifies password management while ensuring a basic level of data protection.

## CODE:

```
<html>
<body>
<div class="box" id="appBox" style="display:none;">
  <h3>Saved Passwords</h3>
  <ul id="list"></ul>

  <button onclick="logout()">Logout</button>
</div>

<script>
// simple encoding
function encrypt(text) {
  return btoa(text);
}

function decrypt(text) {
  return atob(text);
}

// LOGIN
function login() {
  let input = document.getElementById("masterPass").value;

  let saved = localStorage.getItem("master");

  // first time login
  if (!saved) {
    localStorage.setItem("master", encrypt(input));
    alert("Master password set successfully!");
  }
}
```

127.0.0.1:5500 says

Security Question: What is your name?

OK Cancel

The image shows a dark-themed dialog box with a title bar. The text '127.0.0.1:5500 says' is displayed in a light color. Below it, the text 'Security Question: What is your name?' is shown. A text input field is positioned below the question, with a vertical cursor on the left. At the bottom right of the dialog, there are two buttons: 'OK' (highlighted in blue) and 'Cancel' (in a light gray box). The dialog is centered on a dark background.
